1. Regular Expressions in Python

Aim: To match and search for patterns in text using the re module.

CODE:

```
import re
text = "My phone number is 9876543210 and my age is 19."
# Search for a 10-digit number
pattern = r"\b\d{10}\b"
match = re.search(pattern, text)
if match:
    print("Phone number found:", match.group())
else:
    print("Phone number not found")
# Find all numbers
print("All numbers:", re.findall(r"\d+", text))
# Test cases
tests = ["9876543210", "12345", "abcdefghij"]
for t in tests:
    print(t, "->", bool(re.fullmatch(r"\d{10}", t)))
```
