**DSA03-Natural Language Processing**

**List of Lab Program**

**10. Implement transformation-based tagging using a set of transformation rules, apply a simple rule to tag words using python.**

**Code:**

```
import nltk
from nltk.tag import RegexpTagger, SequentialBackoffTagger
text = "The boy plays cricket"
words = text.split()
# Initial tagging
initial_tags = [
    (word, "NN") for word in words
]
# Transformation rules
transformed_tags = []
for word, tag in initial_tags:
    if word.lower() in ["the", "a", "an"]:
        tag = "DT"
    elif word.endswith("s"):
        tag = "VBZ"
    transformed_tags.append((word, tag))
print("Word\t\tPOS Tag")
print("-" * 25)
for word, tag in transformed_tags:
```

```
print(f"{word:<16}{tag}")
```

**Output:**

```
Word            POS Tag
-------------------------
The             DT
boy             NN
plays           VBZ
cricket         NN
```
